LIST OF CHEMICAL COMPOUNDS

Approved for Use Under
USDA Poultry and Poultry
Products Inspection and
Grading Programs

Growth Through Agricultural Progress

LIST OF CHEMICAL COMPOUNDS APPROVED FOR USE UNDER U.S.D.A. POULTRY AND POULTRY PRODUCTS

INSPECTION AND GRADING PROGRAMS

This publication lists chemical compounds approved by the Poultry Division, Agricultural Marketing Service for use in Official Poultry Processing Establishments, that is, in plants operating under U. S. Department of Agriculture Poultry and Poultry Products Inspection and Grading Programs.

It is the policy of the Poultry Division to require the manufacturer, distributor, user or any interested person to submit the following information on any chemical or chemical compound proposed for use in official poultry processing plants.

1. The complete name of each compound submitted.
2. A certification from the company stating that the compound, as it is proposed for use in the official plant, will not deleteriously affect the poultry or poultry products. This certification shall include the conditions under which this compound is believed to be satisfactory for use and the precautions necessary, if any.
3. The complete chemical formula for each compound, as well as the identification of all components in terms of percentages on a 100% basis.
4. One descriptive label for each product.
5. One 4-6 ounce sample of each compound.
6. A copy (if available) of the approval of the product by any other agency within the United States Department of Agriculture.

CONTENTS

PART I COMPOUNDS

This section lists the compounds accepted for use in official poultry processing establishments and identifies by code letter the approved usage of each compound and the conditions limiting the use of the compound.

The following are the code letters used and their meanings.

- A. General cleaning agents for use in all departments.
- B. General cleaning agents for use in all departments with steam cleaners or with recirculating devices.
- C. Acid cleaners in all departments.
- D. Floor and wall cleaners in all departments.

Before using these compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.

- E. Scouring Cleansers.

Residues resulting from the use of abrasives and scouring cleansers must be removed from the equipment by a thorough rinsing with potable water. Special attention to thorough rinsing is required on the part of plant personnel because resident inspectors shall not permit abrasive residues.

F. Sanitizers for use on equipment and utensils

Sanitizers with a concentration of not more than 200 ppm of available chlorine, iodine or quaternary ammonium chloride compounds may be used on equipment and utensils. Before operations are resumed, the equipment and utensils must be thoroughly rinsed with potable water.

G. Liquid Hand Soaps.

The hand soaps must be dispensed from adequate dispensers located on a wall away from the processing line. After the use of the soap, the hands must be thoroughly rinsed with potable water.

H. Wetting Agents for use in scald vats.

Wetting agents may be used in scald vats up to a maximum concentration of one percent.

I. Boiler treatment compounds.

Steam from boiler water treated with these compounds is allowed to contact edible products.

J. Compounds for treating steam lines and closed cooling systems.

Steam or water from lines treated with these compounds is not permitted to contact edible products.

K. Compounds for use in sewage and drain lines only.

L. Compounds for use in toilets, dressing rooms and plant exteriors only.

M. Compounds for use in offal rooms and plant exteriors only

Permission for the use of these compounds on loading docks and similar areas is left to the discretion of the inspectors in charge of the plants.

N. Insecticides - edible product areas.

The following insecticides may be used in all areas:

Deodorized petroleum distillate solutions containing

Organic thiocyanates or lethanes

Pyrethrum extract

Pyrethrins

Allethrins

Rotenone

Concentrations of 1% or less of the following insecticides, singly, or in combinations with other permitted insecticides.

Piperonyl butoxide

N - Propyl isome

N - Octyl dicycloheptane dicarboximide

Sulfoxide

Before using these insecticide compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.

O. Insecticides - inedible product areas.

The use of the following insecticides is limited to inedible products areas:

Deodorized petroleum distillate solutions of:

DDT

Chlordane

Lindane

Malathion

Methoxychlor

Ronnel

Concentrations greater than 1% of the following:

Piperonyl butoxide

N - Propyl isome

N - Octyl dicycloheptane dicarboximide

Sulfoxide

Before using these insecticide compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.

P. Insecticides, rodenticides, fumigants for controlled usage

Insecticides

Under circumstances which preclude contact with the product, the following substances (properly mixed with inert materials) may be used as insect powders:

Sodium fluoride (colored green or blue)

Borax or boric acid

Derris root

Powdered pyrethrum

DDT powder (limited to areas where edible products are not handled).

Powders containing organic thiocyanates or lethanes.

Baits shall not be placed in edible products areas until operations have ceased for the day. Strict account must be kept of the location and the number of baits set. Operations shall not be resumed until all the baits have been gathered and removed.

Rodenticides

The following rodenticides may be used under circumstances which absolutely preclude contact with edible products:

Barium carbonate

Red Squill

Warfarin

Antu (alphanapthylthiourea)

Baits shall not be placed in edible products areas until operations have ceased for the day. Strict account must be kept of the location and the number of baits set. Operations shall not be resumed until all the baits have been gathered and removed.

Fumigants

Permission for the use of fumigants such as methyl bromide gas or hydrocyanic gas must be obtained from the inspector in charge. Fumigants are very dangerous, and may be used only under the supervision of licensed, experienced operators. Poultry products and packaging materials must be removed from the rooms being treated. Before operations are resumed, sufficient ventilation must be provided to assure complete removal of the gases from equipment surfaces before operations are resumed. Thorough washing and a rinsing with potable water must follow fumigation procedures before operations are resumed.

The granting of permission to use marking inks, lubricants, paints and coatings which do not come in direct contact with edible products or packaging materials is left

to the discretion of the Inspector in Charge of the official poultry processing establishment. No approval is necessary from the Washington office.

The Poultry Division accepts water used in official establishments as being potable when such certifications are made by State Health Agency Authorities. Chemicals which have been accepted for use for total in-plant treatment of potable water supplies are chlorine to reduce bacterial population, phosphates as sequestering agents and small amounts of silicates for adjusting pH of the water.

Part II SHELL EGG WASHING COMPOUNDS (Pages 38-39)

This section lists those compounds accepted for use in washing shell eggs. After washing, the eggs must be rinsed with a potable water spray and promptly dried.

Food additives are handled through label approval and not listed in this booklet.

Quality control can be described as the result of a total of factors which include proper selection of raw materials, careful handling, judicious processing, adequate packaging, and effective, consistent sanitation. Proper sanitation is as fully important as the latest in modern equipment.

Flies, roaches, dirty equipment, dirty utensils, piles of trash, strong odors or accumulations of grease all indicate unsanitary procedures. Unless the equipment or utensils are given a good cleaning, chemical disinfectants or sanitizers are not adequately effective. Their use is of little value in the presence of excess organic matter.

Detergents are mixtures of chemicals that change the characteristics of dirt and soil so that they can be separated from the surface of equipment with a solvent, usually water.

Alkaline Detergents will condition the water, penetrate and wet the soil, disperse and emulsify the soil so it can be washed away. The common ones are:

- sodium carbonate
- sodium metasilicate
- sodium hexametaphosphate
- sodium or potassium soaps
- sodium hydroxide
- trisodiumphosphate
- tetra sodium pyrophosphate

Acid Detergents are used primarily for removing scale formed from hard water precipitates. These are:

- Mineral Acids
- Organic Acids

Sanitizers are chemicals which act as bactericides or fungicides to kill bacteria and fungi remaining on the surface after cleaning. These include:

- chlorine
- iodine
- quaternary ammonium compounds
- hydrogen peroxide

These cleaning compounds can be applied with brushes, spray cleaners, steam cleaners, and recirculating or pressure cleaners.
